                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a compound which specifically hybridizes with a nucleic acid molecule encoding GFAT, and inhibits the expression of GFAT. Specifically claimed are antisense oligonucleotides capable of modulating the expression of GFAT, and which comprise any of the 3063 sequences of 20 base pairs, given in the specification. The compound, composition and methods are useful for treating a disease or condition associated with GFAT, such as a disease or condition, e.g. diabetes, a cardiovascular or neurological disorder, ischemia/reperfusion injury. They are also useful in research and diagnostics for modulating the phresent sequence represents a chimeric phosphorothicate oligonucleotide with 2' MOE wings and a deoxy gap, these oligonucleotides inhibit human GFAT expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New compounds, particularly antisense oligonucleotides targeted to a nuclaic acid encoding glutamine-fructose-6-phosphate amidotransferase (GRAT), for treating diabetes, a cardiovascular or neurologic disorder, ischemia/reperfusion injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Glutamine-fructose-6-phosphate amidotransferase; diabetes; ischemia;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                      셤
                                                                                                                                                                                                                                                                        The present invention relates to a compound which specifically hybridizes with a nucleic acid molecule encoding GFAT, and inhibits the expression of GFAT. Specifically claimed are artisense oligonuclectides capable of modulating the expression of GFAT, and which comprise any of the 3063 sequences of 20 base pairs, given in the specification. The compound, composition and methods are useful for treating a disease or condition associated with GFAT, such as a disease or condition, e.g. diabetes, a cardiovascular or neurological disorder, ischemia/reperfusion injury. They are also useful in research and diagnostics for modulating the expression of GFAT. The present sequence represents a chimeric phosphorothicate oligonucleotide with 2'-MCE wings and a deoxy gap, these oligonucleotides inhibit human GFAT expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                     New compounds, particularly antisense oligonucleotides targeted to a
nucleic acid encoding glutamine-fructose-6-phosphate amidotransferase
(GFAI), for treating diabetes, a cardiovascular or neurologic disorder,

The present invention relates to a compound which specifically hybridizes with a nucleic acid molecule encoding GFAT, and inhibits the expression of GFAT. Specifically claimed are antisense oligonuclectides capable of modulating the expression of GFAT, and which comprise any of the 3063 sequences of 20 base pairs, given in the specification. The compound, composition and methods are useful for treating a disease or condition associated with GFAT, such as a disease or condition, e.g. diabetes, a cardiovascular or neurological disorder, ischemia/reperfusion injury. They are also useful in research and diagnostics for modulating the expression of GFAT. The present sequence represents a chimeric phosphorothicate oligonucleotide with 2'-MOE wings and a deoxy gap, these oligonucleotides inhibit human GFAT expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding glutamine-fructose-6-phosphate amidotransferase (GFAT), for treating diabetes, a cardiovascular or neurologic disorder, ischemia/reperfusion injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 transplant rejection; immune system; rheumatoid arthritis; lupus;

                                                                                                                                                                    The present invention relates to diagnosing or monitoring transplant rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, in an enotransplant rejection or mechanical organ replacement rejection, in an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lupus, inflammatory bowel diseases, multiple sclerosis, HIV/AIDS or viral, bacterial or fungal infection. The present sequence represents a primer for a 50 mer oligonucleotide marker for diagnosis and monitoring of allograft rejection and other discorders.

```
New compound targeted to a nucleic acid encoding death-associated protein kinase 1, useful for modulating death-associated protein kinase 1 expression, or treating diseases associated with expression of death-associated protein kinase 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a compound 8-80 nucleobases in length targeted where the compound specifically hybridizes with the nucleic acid molecule encoding death-associated protein kinase 1, where the compound specifically hybridizes with the nucleic acid molecule encoding death-associated protein kinase 1 and inhibits the expression of death-associated protein kinase 1. The compound is useful for the modulation of death-associated protein kinase 1 expression and for diagnosis and treatment of diseases associated with expression of death-associated protein kinase 1 expression. The disease or condition is dysregulation of cellular apoptosis. The compound is also useful in relationships that exist between death-associated protein kinase 1 and disease state, phenotype, or condition. This sequence represents an inhibitory oligonucleotide of the invention which is targeted to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human death-associated protein kinase 1 gene inhibitory oligo ISIS233836.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /note= "phosphorothioate backbone, all C bases are 5-
methylcytidine bases"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ઠ
                                                                                                                                                                                                                                                                                                        The invention relates to a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding death-associated protein kinase 1, where the compound appecifically hybridizes with the nucleic acid molecule encoding death-associated protein kinase 1 and inhibits the expression of death-associated protein kinase 1. The compound is useful for the modulation of death-associated protein kinase 1. The compound is useful for the diagnosis and treatment of diseases associated with expression of death-associated protein kinase 1 expression. The disease or condition is dysregulation of cellular apoptosis. The compound is also useful in research and diagnostics, and for drug discovery to elucidate

This sequence represents and disease state, phenotype, or condition. This sequence represents and inhibitory oligonucleotide of the invention which is targeted to the human death-associated protein kinase 1 gene (ADO59470).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                            New compound targeted to a nucleic acid encoding death-associated protein kinase 1, useful for modulating death-associated protein kinase 1 expression, or treating diseases associated with expression of death-associated protein kinase 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /mod_base= OTHER

The invention relates to a compound, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding BAF53 (a member of the BAF complex (BRG1/brm-associated factor 53kDa which is an actin-related protein), specifically hybridises with the nucleic acid encoding BAF53 comprising 28001-bp sequence (derived from human chromosome 3) and inhibits expression of BAF53, i.e. an antisense oligonucleoride. Also included are inhibiting the expression of BAF53 in cells or tissues, screening for a modulator of BAF53, a diagnostic method for identifying a disease state, a kit or assay device comprising the compound and treating an animal having a disease or condition associated with BAF53. The oligonucleotide compound is useful for preparing a timonum. The present sequence is an antisense oligonucleotide targeting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; ds; antisense; chromatin; BAF complex; BRG1/brm-associated factor; BAF53; BRG1-associated factor 53kDa; cancer; tumour; actin-related protein; hyperproliferative disorder; chromosome 3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New oligonucleotide compound that inhibits expression of BAF53, useful for preparing a composition for treating hyperproliferative disorder, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The invention relates to a microwell array chip for detecting a single antigen-specific lymphocyte. Bach microwell of the chip has the shape and size to accommodate one lymphocyte only. The lymphocyte may be a B or a T lymphocyte. The invention also relates to methods for detecting, isolating and selecting an antigen-specific receptor (e.g., an method of coning a gene encoding an antigen-specific receptor (e.g., an expect immunoglobulin or a T-cell receptor) from an antigen-specific lymphocyte wia reverse transcription-PCR (RT-PCR); a method of manufacturing or a monoclonal antibody using an antigen-specific immunoglobulin gene cloned using the cloning method of the invention; and a method of manufacturing gene therapy material using an antigen-specific T-cell receptor gene cloned using the cloning method. The method of the invention is useful for the efficient detection of a single antigen-specific lymphocyte, genes from which may be isolated and cloned for use in various communication and generally methods. Sequences App21186-ADP21233 response the PCR primers used to clone the heavy and light chain variable regions.
                                                                                                         Microwell array chip for detecting antigen specific lymphocyte, has shape and dimension to store lymphocyte in microwell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New oligonucleotide compound that inhibits expression of alpha-methylacyl -CoA racemase, useful for preparing a composition for treating a condition involving defects in fatty acid metabolism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         alpha-methylacyl-CoA racemase; AMACR; fatty acid metabolism;
gene therapy; ds; human; antisense therapy target.

                                                                                                                                                                                                                                                                                                                             The invention relates to a compound, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding BAF53 (a member of the BAF complex (BRG1/Dram-associated factor), BRG1-associated factor 53Mpa which is an actin-related protein), specifically hybridises with the nucleic acid encoding BAF53 comprising 28001-bp sequence (derived from human chromosome 3) and inhibits expression of BAF53, i.e. an antisense oligonucleotide. Also included are inhibiting the expression of BAF53 in cells or tissues, screening for a modulator of BAF53, a diagnostic method for identifying a disease state, a kit or assay device comprising the compound and treating an animal having a disease or condition associated with BAF53. The oligonucleotide compound is useful for preparing a composition for treating hyperproliferative disorder, e.g. cancer or a tumour. The BAF53 gene is located on chromosome 3. The present sequence of a number of the contract of the contra
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               is a BAF53 genomic DNA target sequence for an antisense oligonucleotides.
                                                                                                                                                                     New oligonucleotide compound that inhibits expression of BAF53, useful for preparing a composition for treating hyperproliferative disorder, e.g. cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           8
                            The invention relates to a novel compound having a sequence comprising 8-80 bp which is targeted to a nucleic acid encoding alpha-methylacyl-COA racemase (AMACR), specifically hybridises with the nucleic acid encoding alpha-methylacyl-COA racemase and inhibits the expression of alpha-methylacyl-COA racemase. The oligonucleotide compound of the invention may be useful for preparing a composition for treating a disease or condition involving defects in fatty acid metabolism, possibly via gene therapy. The current sequence is that of a human AMACR DNA of the invention which was targeted for antisense therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel compound having a sequence comprising 8-80 bp which is targeted to a nucleic acid encoding alpha-methylacyl-CoA racemase (AMACR), specifically hybridises with the nucleic acid encoding alpha-methylacyl-CoA racemase and inhibits the expression of alpha-methylacyl-CoA racemase. The oligonuclectide compound of the invention may be useful for preparing a composition for treating a disease or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /note= "OTHER = Bases 1-5 and 16-20 are 2'-methoxyethyl (2'-MOE) bases, all cytidines are 5'-methylcytidines, phosphorothioate backbone throughout"
                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Antisense 2'-MOE gapmer targeted to human AMACR RNA - SEQ ID 18.
                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 alpha-methylacyl-CoA racemase; AMACR; fatty acid metabolism; gene therapy; antisense; 2'-methoxyethyl gapmer; 2'-MOE wing; phosphorothioate backbone; 8s; human.

The method comprises: contacting the test sample with at least one PS112-specific polynucleotide or its complement; and detecting the presence of the target PS112 polynucleotide in the test sample, where the PS112-specific polynucleotide has at least 50% identity to a polynucleotide comprising a sequence of 367, 214, 205, 256, 246, 277, 251, 233, 2393, or 1297 bp (SEQ ID NOS: 1-10) or their fragments or complements. Also described are: detecting mRNA of PS112 in a test sample; a test kit, useful for detecting PS112 polynucleotide in test sample; a purified polynucleotide or fragment derived from a PS112
condition involving defects in fatty acid metabolism, possibly via gene therapy. The current sequence is that of a antisense 2'-methoxyethyl (2'-MOE) gapmer oligo of the invention which was targeted to human AMACR RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detecting a target PS112 polynucleotide, useful in diagnosing, staging, monitoring, prognosticating, preventing and treating prostate cancer, comprises contacting the test sample with PS112-specific polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    cytostatic, gene therapy, PS112, recombinant expression system; PS112 epitope; prostate disease; tumours; metastasis; predisposition; prostate cancer; RT-PCR; reverse transcriptase PCR; primer; 85.

cc that includes an open reading frame derived from PS112 operably linked to a control sequence compatible with a desired host, where the nucleic acid sequence has at least 50% identity to a sequence of SEQ ID NOS: 1-10, or their fragments or complements; a cell transfected with the recombinant expression system or with a nucleic acid sequence encoding at least one PS112 epitope, where the nucleic acid sequence comprises SEQ ID NOS: 1-0, or their fragments or complements; a composition of matter comprising a PS112 polynucleotide or its fragment, where the polynucleotide has at composition of matter comprising a PS112 polynucleotide or its fragment, where the polynucleotide has at complements, or has at least 50% identity with fragments of a complements or bas at least 50% identity with SEQ ID NOS: 2-10, or their complements or has at least 50% identity with SEQ ID NOS: 9 or 10. The method is DNA having at least 50% identity with SEQ ID NOS: 9 or 10. The method is custing the presence of a target PS112 polynucleotide in a test sample. The methods, test kit, polynucleotides and polypeptides, and continued in detecting and treating prostate diseases, tumours or complements are useful in detecting, diagnoshing, staging, monitoring, prognosticating, preventing and treating prostate diseases, tumours or complements are verse transcriptase PCR primer used to isolate conditions of the prostate, e.g. prostate cancer. This colate conditions of the prostate, e.g. prostate cancer. This colate conditions of the prostate of the prostate cancer. The colate colate cancer transcriptase PCR primer used to isolate transcriptase prostate cancer.

Inhibiting transcription of duplex DNA in anti-sense therapy and diagnosis - by contacting the transcribed region of DNA with an oligomer to form triple helix. diagnosis

rable 1; Page 26; 45pp; English.

The oligomer is used as a control oligonucleotide for studying inhibition of transcription of duplex DNA. Similar oligomers are capable of binding to the transcribed region of the DNA so as to form a triple helix. This interaction is compared to the binding of the control oligonucleotide to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequence represents the DNA sequence encoding a synthetic heptad polypeptide. The synthetic polypeptide can be expressed in vivo in plants to serve as a synthetic seed storage protein which can be custom-tallored for specific end-user requirements. The DNA encoding the heptad may be
give accurate results. The target region may lie within an exon or an intron and the oligomer forms a triple helix by explicting the GT motif (i.e. the oligomer is useful in antisense therapy. It can also be used (opt. in labelled form) diagnostically to detect target DNA or RNA by hybridisation. See also AAQ25290-300.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Heptad; plants; custom tailored storage proteins; in vivo; expression;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Oligonucleotide SM90 (AAQ94988) and complementary sequence SM91 (AAQ94989) code for heptad peptide SSP10 (AAR78247). They were annealed and used in the construction a DNA fragment (see also AAQ94996) that was inserted into vector pSK6 (see also AAR78316). The DNA fragment codes for a synthetic storage protein (SSP) contg. multiple lyaine-rich heptad repeats (see AAR78253). This can be expressed in the seeds of transformed plants, e.g. soybean and corn, to increase lysine content
                                                                                                                                                                                                                                                                                                                                                                                                   New chimeric gene providing increased lysine content in plant seeds - contains di:hydro:di:picolinic acid synthase gene coupled to chloroplast transport sequence and seed specific promoter, also new plants of improved nutritional value.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DNA polymerase I; truncated; exonuclease free; holoenzyme; universal;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ઠ
```

```
polymerase coding sequence, e.g. an exonuclease-free fragment (Tfl exo-fragment). This recombinant polymerase is thermostable and can be used in applications such as DNA sequencing, polymerase chain reaction, (universal) thermal cycle labelling and ligase chain reaction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAT27263-88 were synthesised for primer walking to obtain the remainder of the sequence of the Thermus flavus DNA polymerase I (holoenzyme) gene. The Tfl DNA pol I sequence can be used to generate a truncated DNA
                                                                                                                                                                                                                              Biologically active fragments of Thermus flavus DNA polymerase - useful for DNA sequencing, polymerase chain reaction, thermal cycle labelling and ligase chain reaction, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DNA polymerase I; truncated; exonuclease free; holoenzyme; universal; DNA sequencing; amplification; polymerase chain reaction; primer; ligase chain reaction; thermal cycle labelling; PCR; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

AAT27263-88 were synthesised for primer walking to obtain the remainder of the sequence of the Thermus flavus DNA polymerase I (holoenzyme) gene. The Tfl DNA pol I sequence can be used to generate a truncated DNA polymerase coding sequence, e.g. an exonuclease-free fragment (Tfl exofragment). This recombinant polymerase is thermostable and can be used in applications such as DNA sequencing, polymerase chain reaction, (universal) thermal cycle labelling and ligase chain reaction,
           Biologically active fragments of Thermus flavus DNA polymerase - useful

The inhibitor is used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient having a specific inhibitor (ASI) targeted to an allele of a first essential gene present in cells of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene present in a population and targets only one allelic form present in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        normal somatic cells, and the first gene. The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic lesions, benign tumours, endometriosis, polycystic kidney disease, and graft versus host disease. The method can also be used to remove malignant cells from bone marrow transplants. AAZ25812-Z26825 represent human polymorphic sites described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Identifying target genes for allele-specific drugs - used for diagnosis, prevention and treatment of, e.g. cancers, atherosclerotic plaque, dysplastic lesions, endometriosis or graft versus host disease.

This primer is used for the PCR amplification of the exon 7 of human epithelial Cell lines 1040-21G (ATCC CRL 11730), TOV-112D (ATCC CRL 11731), TOV-112D (ATCC CRL 11731), OV-90 (ATCC CRL 11732), TOV-112D (ATCC CRL 11731), OV-90 (ATCC CRL 11732) and NOV-31 (ATCC CRL 11733). These cell lines which are new function as models for studying the ovarian expithelium under normal and pathological conditions, to assess the expression of genes involved in tumour suppression or tumour promotion. The cell lines can be used to screen for drugs that influence matrix metalloprotease activity and to screen for compounds useful in human or veterinary medicine through their influence on tumourogenicity, invasive potential or metalloprotease activity

ovarian epithelial cell lines - useful for cancer research, drug

This invention describes a novel method for identifying an inhibitor potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele specific inhibitor (ASI) targeted to an allele of a first essential gene present in cells of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             present in a population and targets only one allelic form present in the normal somatic cells, and the first gene. The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic lesions, benign tumours, endometriosis, polycystic kidney disease, and graft versus host disease. The method can also be used to remove malignant cells from bone marrow transplants. AZZS812-Z26825 represent

used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele specific inhibitor (ASI) targeted to an allele of a first essential gene present in cells of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor present in a population and targets only one allelic forms of the gene normal somatic cells, and the first gene. The products and methods can be normal somatic cells, and the first gene. The products and methods can be used in the diagnosals, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic lesions, benign tumours, endometriosis, polycystic kidney disease, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes a novel method for identifying an inhibitor potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying target genes for allele-specific drugs - used for diagnosis, prevention and treatment of, e.g. cancers, atherosclerotic plaque, dysplastic lesions, endometriosis or graft versus host disease.
                                                                                                                                                                                                                                                                                     cell viability, loss of heterozygosity; precancerous condition; ASI; allele specific inhibitor; somatic cell; diagnosis; prevention; atheroscierotic plaque; premalignant metaplastic lesion; endometriosis; dysplastic lesion; benign tumour; polycystic kidney disease; transplant; graft versus host disease; malignant cell removal; bone marrow; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           graft versus host disease. The method can also be used to remove malignant cells from bone marrow transplants. AAZ25812-Z26825 represent human polymorphic sites described in the method of the invention

The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in a selected gene family; and (c) calculating a proximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its genetic status, whether it carries a genetic defect, or whether it is transformed. They can be used for determining the effect of a selected treatment on a test cell. They can also be used for obtaining cells capable of expressing an homeobox related desired containing cells capable of expressing an homeobox related desired (RT-PCR) for determining the pattern of gene expression in a selected gene family. Sequences AAZIN803-z18342 represent primers that can be used in the RT-PCR reactions to determine the pattern of gene expression. The
                                                                                                          Genetic proximity, gene expression, cell characterisation, homeobox gene; genetic defect, reverse transcriptase polymerase chain reaction, RT-PCR, kinase gene, protein phosphatase, P450, steroid receptor, cadherin,

```
The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a second cell compises: (a) obtaining the first cell and the second cell compises: (a) obtaining the first cell and the second cell the pattern cell; (b) determining in the first cell and the second cell the pattern of expression of genes in a selected gene family; and (c) calculating a compositive index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its characterising cells, e.g. for determining the origin of a cell, its contained. They can also be used for determining the cit an individual, e.g. a fetus. They can also be used for determining the ceffect of a selected treatment on a test cell. They can also be used for obtaining cells capable of expressing an homeobox related desired property. The method uses reverse transcriptase polymerase chain reaction (RP-PCR) for determining the pattern of gene expression in a selected on the RP-PCR reactions to determine the pattern of gene expression. The can be used from a set of homeobox genes, kinase genes, protein phosphatase genes, P450 enzyme genes, steroid receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

```
The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in a selected gene family; and (c) calculating a proximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its genetic status, whether it carries a genetic defect, or whether it is cransformed. They can be used for determining the origin of a selected treatment on a test cell. They can also be used for obtaining cells capable of expressing an homeobox related desired containing the method uses reverse transcriptase polymerase chain reaction (RT-PCR) for determining the pattern of gene expression in a selected gene family. Sequences AAZINS03-ZIS332 represent primers that can be used in the RT-PCR reactions to determine the pattern of gene expression. The
The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and as ascond cell comprises: (a) obtaining the first cell and the second cell comprises: (a) obtaining the first cell and the second cell comprises: (b) determining in the first cell and the second cell the pattern of expression of genes in a selected gene family; and (c) calculating a profifted formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its centransformed. They can be used for detecting a selected genetic defect in an individual, e.g. a ferus. They can also be used for determining the obtaining the captes of the selected treatment on a test cell. They can also be used for obtaining cells capable of expressing an homeobox related desired compression in a selected property. The method uses reverse transcriptase polymerase chain reaction (RT-PCR) for determining the pattern of gene expression in a selected gene family. Sequences AAZ1780-Z18342 represent primers that can be used in the RT-PCR reactions to determine the pattern of gene expression. The gene family can be selected from a set of homeobox genes, kinase genes, conversally can be selected from a set of homeobox genes, kinase genes, increasing the pattern of genes, steroid receptor

```
A method has been developed of determining the Human Leukocyte Antigen class II (HLA Class II) group type of a subject. The method comprises:

(1) amplifying a target DNA sample from a subject using a particular HLA group-specific primer pair (sequence specific primer PCR - SSP-PCR); and (ii) determining whether a nucleic acid product is produced, therefore identifying the group type. AAX00303 to AAX0030s represent specifically claimed oligonucleotide primer for use in the above method. These coligonucleotide primer for use in the above method. These coligonucleotides are useful for determining the HLA Class II type of a patient sample, by identifying the specific alleles present and determining the group specificity of alleles. Steps (i) and (ii) in the method are diagnostically useful for histocompatibility analysis to see if donor and recipient groups match. The new sequences are useful for providing an insight into the genetic relationship between different corporation and recipient for group match can be grounded and alleles as few exon sequences offer conserved methods using exon based primers is more efficient than prior art methods using exon based primers, as few exon sequences offer conserved primer binding sites, resulting in a limited number of primer pairs and insufficient specificity for alleles, as allelic variations exist between the primer sites. The SSP-PCK method allows separation of haplotypes in the primer sites. The SSP-PCK method allows separation of cis-trans linkages of the patient samples, allowing resolution of cis-trans linkages of
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Determining the Human Leukocyte Antigen Class II type Histocompatibility antigens - by using new intron-specific oligonucleotide primers for sequence specific primer PCR and sequencing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             acute asthma; allergy; asthma; impeded respiration; respiratory distress syndrome; pain; cystic fibrosis; pulmonary bypertension; pulmonary vasoconstriction; emphysema; ohronic obstructive pulmonary disease; leukemia; lymphoma; carcinoma; colon cancer; breast cancer; lung cancer; pancreatic cancer; hepatocellular carcinoma; kidney cancer; melanoma; hepatic metastasis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell; (c) determining in the first cell and the second cell; (d) determining in the first cell and the second cell; (e) determining in a selected gene family; and (c) calculating a proximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its genetic stauts, whether it carries a genetic defect, or whether it is cransformed. They can be used for determining the an individual, e.g. a fetus. They can also be used for an individual, e.g. a fetus. They can also be used for obtaining cells capable of expressing an homeobox related desired property. The method uses reverse transcriptuse polymerase chain reaction (RT-PCR) for determining the pattern of gene expression in a selected in the RT-PCR reactions to determine the pattern of gene expression. The contraction that the pattern of gene expression. The property can be selected from a set of homeobox genes, where the pattern of gene expression. The property can be selected from a set of homeobox genes, and the pattern of gene expression. The property can be selected from a set of homeobox genes, and the pattern of gene expression. The pattern of gene expression in a selected capable of the pattern of gene expression. The pattern of gene expression in a selected capable of the pattern of gene expression. The pattern of gene expression in a selected capable of the pattern of gene expression. The pattern of gene expression in a selected capable of the pattern of gene expression. The pattern of gene family capable selected from a set of homeobox genes, which is pattern of gene expression. The pattern of gene family capable selected from a set of homeoper genes, and the pattern of gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying and characterizing cells by comparing the pattern of gene expression in a selected gene family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

Antisense oligonucleotides (ASO) for inhibiting a tumour necrosis factoralpha) gene in an animal, preferably a human, comprise 12-50 nucleotides, 90% of which are complementary to a region of mRNA containing a GGGA sequence motif. The ASO is used to inhibit expression of a gene in an animal and for treating the animal when afflicted with a disease or disorder characterised by the presence of an mRNA from a gene containing a GGGA motif. The ASO are specifically targeted to a GGGA sequence motif found in mRNA from a gene. A study of known ASO has shown that at least half of the most efficacious ASO's contain one or more TCCC against This ASO is designated TUU-0656 and is based on and targetted against the rat TNF-alpha sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human ABC1 cholesterol transporter; chromosome 9q31; ATP-binding cassette; HDL deficiency disorder; hlgh density lipoprotein; Tangier disease; TD; familial HDL deficiency; FHA; polymorphism; cardiovascular disease; coronary artery disease; coronary restenosis; cerebrovascular disease; coronary artery disease; coronary restenosis; cerebrovascular disease; peripheral vascular disease; Albachimer's disease; X-linked adrenoleukodystrophy; cancer; gene therapy; genetic diagnosis; prophylaxis; drug screening; transgenic animal; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The specification describes antisense oligonucleotides (AAX52869-X5571)

directed against at least 2 mRNAs selected from target genes, coding and

conn-coding regions of RNAs corresponding to target genes, gene initiation

codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'

codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'

codons, mixtures. The antisense oligonucleotides may be derived

from sequences AAX55272-74. These multiple target oligonucleotides

conditions or mixtures. The multiple target oligonucleotides

from sequences AAX55180-271) can be used for the antisense treatment of

diseases and conditions. Typical diseases and conditions are those

associated with impaired respiration and inflammation, including lung

diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,

acute asthma, allergies, asthma, impeded respiration, respiratory

diseases syndrome, pain, cystic fibrosis, pulmonary hypertension,

pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary

disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.

colon cancer, breast cancer, hung cancer, paincreatic cancer,

colon cancer, breast cancer, melanoma, hepatic metastasized

colon cancer, breast cancer, melanoma, hepatic metastasized

to the lungs, including breast and prostate cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Tumour necrosis factor alpha; TNF-alpha; antisense oligonucleotide; ASO; inhibition; expresssion; treatment; disease; disorder; ss.

The invention relates to the human ABC1 cholesterol transporter protein

(B38082) and to nucleic acid sequences (C69120) which encode it. ABC1 is
a member of the ATP-binding cassette (ABC transporter) superfamily of
the ATP-binding cassette (ABC transporter) superfamily of
corrections, and plays a crucial role in cholesterol transport, particularly
convolved in cholesterol Efficiking in monocytes and fibroblasts, being
convolved in cholesterol efficik from the cell. The gene encoding ABC1 is
clocated on chromosome 9q31 and mutations in this gene encoding ABC1 is
convolved in cholesterol by and familial HDL deficiency (FHA). These diseases
convolved in cholesterol in the blood correlate with a high risk of cardiovascular
cholesterol in the blood correlate with a high risk of cardiovascular
disease, coronary restencesis, and peripheral vascular disease.
conversely, a high level of HDL has protective effects against
cardiovascular disease. The invention promptising human ABC1 nucleic

New antisense oligonucleotides useful for treating e.g. pulmonary vasoconstruction, inflammation, allergies, asthma, hypertension, bronchitis, emphysema, respiratory distress syndrome, ischemia or cancers.

Example 5; Page 257; 1343pp; English.

The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%) which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antialial antial ergies, and/or antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation.

Consecul for the treatment of diseases and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating e.g. including lung diseases and diseases whose secondary condetions, pulmonary vasconstriction, allergies, asthma, confined respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (CODP), and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the ONS reduces side effects. The A-containing ONS break down with the concentration and inflammation. AAA32313 to AAA35312 represent the nucleotide sequences given in the sequence listing from the present convention, which correspond to SEQ ID NO:1 to 2815, and then the last 185 from the previously named sequences. SEQ ID NO:1 to 1680 (AAA32332 to AAA3392) are specifically claimed ONS from the present invention. N.B. Sequences given in the disclosure of the present invention in the disclosure of the present invention of the present intending the disclosure of the present invention. N.B. Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers

and respiratory obstructions.

The present invention describes low adenosine (A) content antisense oligonucleotides the A is replaced by a 'Universal' or alternative base. C. (1) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities.

(I) can have respiratory bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities.

C. (I) can have respiratory disorders and malignancies, such as stimulating and expression and or activity of target polypeptides associated with corresponding peptide factors and transmitters, transcription factors, immunoglobuline and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, chemokine receptors, adenosine receptors, cytokines and chemokine receptors, adenosine receptors, brinding proteins, adenosine receptors, bradykinin receptors, cotokine and creaming respiratory obstruction and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders and receptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction) and/or lung inflammation, allergy (les) and/or surfactant hypoproduction which are associated with a disease or condition selected from pulmonary vasoconstriction, inflammation, allergic fibrosis (RDS), pain, cystic fibrosis (CP), malmonary disease (CPDD), conditions between complements, infant prominers, and processes and medically pulmonary disease (CPDD), conditions and conditions elected from pulmonary vasoconstriction elected from pulmonary infantion elected from pulmonary vasoconservatory distress syndrome conditions elected from pulmonary vasoconservatory distress syndrome conditions and pulmonary infantions elected from pulmonary infantions elected from pulmonary infantions elected from pulmonary infantions elected f
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   pulmonary transplantation rejection, pulmonary infections, bronchitis, and/or cancer. AAF18434 to AAF21543 represent human polynucleotide fragments and antisense oligonucleotides used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 14; Page 306; 1592pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The patent discloses Arabidopsis thaliana chloroplast targetted beta-amylase (ct beta-amylase) gene and a light or sugar inducible promoter sequence located on chromosome 4. Transgene comprising ct beta-amylase gene and the promoter sequence may be used to transform plants to alter the activity of starch biosynthesis or degradation pathway enzymes, target proteins or enzymes to plant plastids, alter seed set and impart herbicide or pest resistance. Manipulation of the amount of starch in plastids of leaves or storage organs, finds use in tobacco, potato crisp industry and others involving malting of grain, production of syrups and alcohol, paper making, pharmaceuticals, glue, oil, textiles and dairy products. The present sequence is the PCR primer P2, used for amplification of cDNA encoding A. thaliana chloroplast targetting transit peptide from ct beta-amylase gene located in cosmid AAG16599
                                                                                                                                                                                                                                                                                                                 Primer P2 to amplify A. thaliana chloroplast targetting transit peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel beta-amylase genes, useful for regulating starch in transgenic plants, has a chloroplast targeting sequence and new promoter sequence useful for the control of transgenic gene expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is an antisense oligonuclectide targeted at the adenosine A2D receptor. It was used to demonstrate the methods of the invention, which involve the use of antisense oligonucleotides to determine the existence of a correlation between a disease and a gene or mRNA encoding a protein thought to be associated with that disease. The antisense strand hybridises with the coding sequence, causing protein production to be reduced and enabling the assessment of the effects of this compared to normal protein production. It can be used to identify genes encoding proteins involved in the function of the CNS, such as those connected to pain, satiety, anxiety and mood disorders, libido, cognition and cognitive disorders, brain trauma, Alzheimer's disease, conditions, and cancers
                                                                                                            Adenosine A2b receptor; phosphorothioate; validating target gene; pain satiety; anxiety; mood disorder; libido; cognition; sleep; cancer; respiratory condition; pulmonary condition; antisense oligonucleotide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Determining the existence of a correlation between the pathology of a disease and a gene or mRNA encoding a target polypeptide suspected of being associated with the disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention is concerned with the isolation of a number of versions of the Drosophila Na+ anion driven exchanger NDAE1 coding sequence. They were isolated by sequencing expressed sequence tags and determining the function of the proteins. The NDAE1 protein is involved in the regulation of intracellular ion concentrations, and agonists and antagonists can be used in the treatment of a number of neurological and muscular diseases, as well a cardiac arrhythmias, hypertension, hypotension, angina, asthma, diabetes, renal insufficiency, urinary incontinence, acidosis, alkalosis, irritable colon, epilepsy, oreceptorvascular isochamia and autoimmune disease. The nddel gene can be used in the production of transgenic animals, such as knockout animals. Primers AAA93712-A93752 and AAA94200-A94222 were all used in the
                                                                       Drosophila Na+ driven ion exchanger gene ndael PCR primer SEQ ID NO: 40.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New purified DNA useful in assays to detect the ability of agents which inhibit or enhance NDAE1 channel activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Oligonucleotide array; genotyping; single base extension reaction; SBE; polymorphic locus; single nucleotide polymorphism; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sciortino CM, Shrode LD, Sussman CR;

The present invention relates to an oligonucleotide array comprising oligonucleotide tags fixed to a solid substrate. The oligonucleotide array is useful for genotyping a nucleic acid sample at one or more loci via single base extension (SBE) reactions. A pair of primers is used to amplify a polymorphic locus in a sample e.g. a single nucleotide polymorphism (SNP). The present sequence is one such polymorphic locus used in the present invention. The amplified nucleic acid product is then used as a template in a SBE reaction with an extension primer. The SBE reaction products are used to form the oligonucleotide array. Note: This sequence includes a SNP represented by the degenerate codon in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Oligonuclectide array; genotyping; single base extension reaction; SBE; polymorphic locus; single nucleotide polymorphism; 88.
                                                                                                                                                                                                                                                                                              Universal array of oligonucleotides tags attached to a solid substrate along with locus-specific tagged oligonucleotides useful in genotyping using single base extension reactions.
                                                                                                                                                                                                                     Hirschhorn JN, Huang X, Kaplan P, Lander ES, Lockhart DJ;

                                                                                                                                                                                                                                                       then
                                                                                                                                                                     The present invention relates to an oligonucleotide array comprising oligonucleotide tags fixed to a solid substrate. The oligonucleotide array is useful for genotyping a nucleic acid sample at one or more loci via single base extension (SBE) reactions. A pair of primers is used to amplify a polymorphic locus in a sample e.g. a single nucleotide polymorphism (SNP). The present sequence is one such polymorphic locus used in the present invention. The amplified nucleic acid product is then used as a template in a SBE reaction with an extension primer. The SBE reaction products are used to form the oligonucleotide array. Note: This sequence includes a SNP represented by the degenerate codon in the

                                                                                                                                                                                                                                                                   The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; variant thrombospondin 1; variant thrombospondin 4; SNP; polymorphism; vascular disease; coronary artery disease; forensics; myocardial infarction; atherosclerosis; stroke; venous thromboembolism; pulmonary embolism; paternity test; ds.

                                                                                                                                                        The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thrombosmbolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a method for treating a patient diagnosed as having a lower than normal high density lipoprotein. cholesterol (HDL-C) level, a higher than normal triglyceride level, or a cardiovascular disease, involving administering a compound that modulates Ltx. or RXR-mediated transcriptional activity or ABC1 expression or activity. The LXR gene product may be used in an assay to identify compounds useful for the treatment of a disease or condition selected a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Treating a lower than normal high density lipoprotein-cholesterol (HDL-C) level, a higher than normal triglyceride level, or a cardiovascular disease, by administering a compound that modulates LXR- or RXR-mediated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     High density lipoprotein-cholesterol; HDL-C; cardiovascular; ABC1; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention relates to a process for detecting cytosine methylation and methylated Cytosinals. The process comprises contacting a genomic sample of DNA with an agent that modifies unmethylated cytosines to produce a converted nucleic acid. The converted nucleic acid sequence is simplified using two primers (optionally in the presence of a specific probe) and the methylated nucleic acid is detected based on amplification—mediated digestion. The method is useful for determining methylation statems of CpG islands within samples and for determining the methylation status of CpG islands within samples of genomic DNA sequences AAP22091 - AAF22094 represent PCR primers and probes specific for certain human gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a polynucleotide comprising an Skp 2 promoter sequence. The polynucleotide or a plasmid of vector comprising the polynucleotide is useful as a pharmaceutical, and in manufacturing a medicament for the treatment of cancer such as cancers of the breast head or neck, lung, stomach, colon, rectum, or uterine cervix. The promoter is useful in tumour and cancer therapy to kill or reduce the growth, division or viability of tumour or cancer cells. The present sequence is a mutant of mouse Skp2 promoter E2F second region binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New polynucleotide comprising an Skp 2 promoter sequence, useful as a pharmaceutical and in manufacturing a medicament for the treatment of cancer such as cancers of the breast, head, neck, lung stomach, colon,
                                                                                                                  Mouse Skp2 promoter E2F second region binding site mutant #1.

```
The invention relates to a nucleic acid comprising single nucleotide polymorphisms (SNPs) associated with diseases. The nucleic acids comprising the SNPs and probes and primers for detecting them may be used in assays for the diagnosis of diseases associated with SNPs (such as congrising the SNPs and probes and primers for detecting them may be used in assays for the diagnosis of diseases associated with SNPs (such as SICKIE cell anaemia, agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan SCC syndrome, muscular dystroppy, Wiskott-Aldrich syndrome, Fabry's disease, familial hypercholesterolaemia, polycystic kidney disease, hereditary spheroxytosis, Von Willebrand's disease, tuberous sclerosis, hereditary syndrome, osteogenesis imperfecta, and acute intermittent porphyria, syndrome, osteogenesis imperfecta, and acute intermittent porphyria, syndrome, osteogenesis imperfecta, and acute intermittent porphyria, symptoms of, or susceptibility to, multifactorial diseases of which a component is or may be genetic, such as autoimmune diseases of which a component is or may be genetic, such as autoimmune diseases of which a thritis, multiple sclerosis, diabetes (insulin-dependent and non-confidence), systemic lupus erythematosus and Graves disease, cancers including cancers of the bladder, brain, breast, colon, oesophagus, the stomach and unterus, longevity, and susceptibility or receptivity to particular drugs or therapeutic treatments), in forensics and in paternity testing. Absidness and in paternity testing, Absidness and in paternity testing, Absidness and in paternity testing. Absidness and in paternity testing and the bladder, breast treatments), in forensics and in paternity testing and the breast colon, desceptibility or and in paternity testing and the breast colon, desceptibility or the patricular drugs or therapeutic treatments), in forensics
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

```
The invention relates to a nucleic acid comprising single nucleotide

polymorphisms (SNPs) associated with diseases. The nucleic acids

comprising the SNPs and probes and primers for detecting them may be used

in assays for the diagnosis of diseases associated with SNPs (such as

sickle cell anaemia, agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan

syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Fabry's disease,

familial hypercholesterolaemia, polycystic kidney disease, hereditary

syndrome, osteogenesis imperfects, and acute intermittent porphyria,

syndroms of, or susceptibility to, multifactorial diseases of which a

component is or may be genetic, such as autoimmune diseases,

component is or may be genetic, such as autoimmune diseases,

component is or susceptibility to, multifactorial diseases of which a

component is or susceptibility to, multifactorial diseases

component is or succeptibility to, and factorial diseases

component is or succeptibility to, and factorial diseases

component is or succeptibility to, and sucception by

pathogenic microorganisms, autoimmune diseases, cancers

inflammation, cancer, diseases of the nervous system, and infection by

pathogenic microorganisms, autoimmune diseases, cancers

including cancers of the bladder, brain, breast, colon, ossophagus,

conceptivity, leukaemia, liver, lung, oral cavity, ovary, pancreas, prostate,

skin, stomach and uterus, longevity, appearance (e.g., baldness,

creceptivity to particular drugs or therapeutic treatments), in forensics

and in paternity testing. ABK65381-ABK65841 represent human single

cup components of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 21 BP; 2 A; 9 C; 7 G; 2 T; 0 U; 1 Other;

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. are mixed clones are cultured and the calculant cultures are amplified by using the above primer; (g) signals are detected from the amplified by using the above primer; (g) signals are detected from the amplified by using the above primer; (g) here are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                      Human; chromosome 1p36-35; chromosome 21q22.1; genetic analysis; genome;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. AB142957 to AB145322 represent PCR primers for human chromosome 1036-35 DNA, and AB145323 to AB145634 represent PCR primers for human chromosome 21q22.1, which are specifically claimed for use in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0.4%; Score 14.8; DB 1; Length 21;

The invention relates to a multidrug resistance-associated protein 1 (MRP -1) polynucleotide. The polynucleotide is useful in an in vitro method for identifying as single nucleotide polymorphism and for identifying and obtaining a pro-drug or drug capable of modulating the activity of a molecular variant of MRP-1 or for identifying and obtaining an inhibitor of the activity of a molecular variant of MRP-1. The sequences are useful for diagnosing a disorder related to the presence of a molecular variant of MRP-1 or susceptibility to such a disorder, where the disorder is cancer (particularly renal cancer) or a disease related to multidrug resistance. This sequence represents a human MRP-1 polymorphic DNA region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel multidrug resistance-associated protein 1 polynucleotide useful for diagnosis and treatment of cancer and multidrug resistance related diseases, and for identifying single nucleotide polymorphisms.
                          Human; multidrug resistance-associated protein 1; MRP-1; ss; cancer; renal cancer; cytostatic; single nucleotide polymorphism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, multidrug resistance-associated protein 1; MRP-1; ss; cancer; renal cancer; cytostatic; single nucleotide polymorphism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0.4%; Score 14.8; DB 1; Length 21;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes a novel method for determining the genetic risk of arteriosclerosis both for clinical diagnosis and for population studies. The method comprises: (i) selecting risk-associated reference nucleic acid sequences, including their functionally characterizing complements, to a carrier; (iii) hybridising the probes with a nucleic acid from (or synthesised from) a patient sample; and (iv) detecting and evaluating the hybridisation pattern. The method provides a quick, inexpensive and informative diagnosis, and makes possible a miltifactorial analysis for detecting e.g. synergism between different mutations or mutations that when present alone carry no risk but are risk associated in presence of other mutations. The results may be combined with known risk-assessment methods to provide a more reliable diagnosis, especially important with new therapeutic methods (e.g. gene therapy) that are directed against specific genes. All relevant mutations in a reference sequence can be screened for in a single test and the method is well suited to automation. 1) polymucleotide. The polymucleotide is useful in an in vitro method for identifying a single nucleotide polymorphism and for identifying and obtaining a pro-drug or drug capable of modulating the activity of a molecular variant of MRP-1 or for identifying and obtaining an inhibitor of the activity of a molecular variant of MRP-1. The sequences are useful for diagnosing a disorder related to the presence of a molecular variant of MRP-1 or susceptibility to such a disorder, where the disorder is cancer (particularly renal cancer) or a disease related to multidrug
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             antianginal; cardiant; vasotropic; antiatherosclerotic; vulnerary; cerebroprotective; antiulger; antiasthmatic; antiallergic; antimigraine; nootropic; tranquilliser; neuroleptic; antimanic; antidepressant; stroke; antiemetic; gene therapy; hypertension; urinary retention; osteoporosis; angina pectoris; myocardial infarction; restenosis; atherosclerosis; aneuryem; wound healing; ischaemia; ulcer; asthma; allergy; migraine; vomiting; benign prostatic hypertrophy; psychotic; neurological disorder; degenerative disease; PCR primer; ss.
                                                                                                                                       Novel multidrug resistance-associated protein 1 polynucleotide useful for diagnosis and treatment of cancer and multidrug resistance related diseases, and for identifying single nucleotide polymorphisms.
                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a multidrug resistance-associated protein 1 (MRP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             resistance. This sequence represents a human MRP-1 polymorphic DNA region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Movel human adenylate cyclase type IV protein, regulators of which are useful for treating and preventing atherosclerosis, hypertension, osteoporosis, ulcer, asthma, allergy, psychotic and neurological disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; adenylate cyclase type IV; enzyme; hypotensive; osteopathic;

The present invention describes human adenylate cyclase type IV (I). (I) has hypotensive, osteopathic, antianginal, cardiant, vasocropic, antiatherosclerotic, vulnerary, cerebroprotective, antiulcer, antiallerotic, concluding the treatment of an adenylate cyclase type IV dysfunction related disease, in particular hypertension, urinary retention, osteoporosis, angina pectoris, myocardial infarction, ceretensists, atherosclerosis, a disease characterised by excessive smooth muscle cells or reduced smooth muscle cell proliferation, aneurysms, wound healing stroke, ischaemia, ulcer, asthma, allergy, benign corder, including anxiety, schizophrenia, manic depression, depression, delirium, dementia, severe mental retardation and degenerative diseases. The present sequence represents a PCR primer for amplifying the adenylate cyclase type IV gene from a human endothelial cell cDNA library in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /*tag= a /*tag= https://withchistory.etrand.coverhangs/hote= "the 3'end of this strand by the sequence 5'-UU-3'"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New method for the synthesis of target-specific short double stranded RNAs by hybridizing the sense oligonucleotide product with the complementary antisense oligoribonucleotide product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acid synthesis; small interfering RNA; siRNA; RNA polymerase; promoter; T7; transcription; EGFP; green fluorescent protein; ds.

combining a target-specific sense or antisense collocurication and a chain extending enzyme in a reaction mixture so,that the template extended sense or antisense oligonucleotide product is formed; and (b) hybridizing the sense oligonucleotide product with the complementary antisense oligoribonucleotide product. The target-specific ds RNAs are useful in RNA interference in vertebrate and invertebrate systems as small interfering RNAs (siRNAs). The method provides truncated RNA polymerase promoter sequences, where the substitutions do no affect the in vitro transcription yields, but increase the possibility that at least one target-specific sequence of a defined sequence length exists in the RNA of the target protein. Sequence ACCY8430-431 represent BGFP target-specific ds siRNAs used in a FACS analysis of EGFP-transfected HeLa cells
specific short double stranded (ds) RNAs. The method involves:

Transformed plants that accumulate lysine at higher levels in its seeds than untransformed plants, has gene fragments encoding lysine-insensitive dihydrodipicolinic acid synthase and lysine ketoglutarate reductase.

Example 21; Col 79; 109pp; English.

The invention relates to a plant comprising two foreign nucleotide sequences which cause seeds obtained from the plant to accumulate lysine at a level of at least 10% higher than seeds of a plant that do not comprise the nucleotide, where the nucleotide comprises a fragment encoding a dihydrodipicolinic acid synthase (DHDPS) that is insensitive to lysine inhibition, and a fragment encoding a plant lysine ketoglutarate reductase (LKR) or its subfragment. The nucleotide fragment is operably linked to a plant chloroplast transit sequence (CTS) and the plant lysine ketoglutarate reductase subfragment is used in antisense ADA15942/C

above mentioned plant and seeds obtained from the above mentioned plant. The seeds obtained from the above mentioned plant. The seeds obtained from the above mentioned plant (e.g., rapeseed, soybean or corn) comprising the foreign nucleic acid sequences accumulate lysine at a higher level, preferably at a level of at least 10% higher than seeds of a plant that do not comprise the foreign nucleic acid asquences. Chimaeric gene comprising DHDPS from C. glutamicum and aspartchinase III (from the lysC gene) of E. coli (mutated to be lysine-insensitive) are also used to generate the above transgenic plants. Also disclosed are synthetic seed storage proteins (SSP) used as an internal source of lysine, built up from synthetic peptide monomers based around an Earl site sequence (for generating mutlimeric proteins). The present sequence is a strand of an oligonucleotide encoding an SSP monomer.
inhibition or cosuppression. Also included are progeny plants from the

New nucleic acid fragment encoding aspartokinase and dihydrodipicolinic acid synthase, useful for increasing threonine or lysine content of seeds acid synt.

Example 21; Page 43; 116pp; English.

The invention relates to an isolated nucleic acid fragment comprising a first nucleic acid subfragment encoding aspartokinase (AK) that is substantially insensitive to inhibition by lysine, and a second nucleic acid subfragment encoding dihydrodipicolinic acid synthase (DHDPS) that is substantially insensitive to inhibition by lysine. Also included are an isolated nucleic acid fragment comprising a nucleic acid subfragment encoding lysine ketoglutarate reductase (LKR), a chimaeric gene (where

```
the mucleic acid fragment is operably linked to a plant chloroplast transit sequence and to a seed-specific regulatory sequence, a plant comprising the mucleic acid/chimaeric gene in its genome, a seed obtained from the plant, increasing threonine or lysine content of the seeds of plant having the ability to produce levels of free threonine or lysine at least two times greater than the free threonine levels of untransformed least two times greater than the free threonine levels of untransformed least two plants, a transformed (soybean) plant comprising seeds that accumulate lysine at a level at least two percent to four-fold higher than the seeds of an untransformed rapesed comprising seeds that accumulate lysine to a level between ten percent and one hundred percent of opportising in its genome the nucleic acid fragment having the monocot-comprising in its genome the nucleic acid fragment having the monocot-comprising in its genome the nucleic acid fragment having one hundred that the percent higher than the seeds of the untransformed plant. Also thirty percent higher than the seeds of the untransformed plant. Also cisclosed are synthetic lysine-rich seed storage proteins (SSP), built up from monomer lysine-rich seed storage proteins (SSP), built up from monomer lysine-rich seeds to a pool of lysine in a transformed plant. The nucleic acid fragments, genes and methods are useful for increasing threonine or lysine content of the seeds of the need to supplement mixed grain feeds with lysine or threonine produced via microbial fermentation. The method is useful in detecting or quantitating a nucleic acid analyte in a sample. The present sequence represents a probe for human FC mRNA, which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
oligonucleotides contain a gene sequence of a spacer region between genes encoding 16S rRNA and 23S rRNA of Pediococus dextrinicus, P. parvulus, P. acidilactici or P. pentosaceus. The oligonucleotides of the invention are useful as primers for detecting P. dextrinicus, P. parvulus, P. acidilactici and P. pentosaceus, in beer brewery and in fermented-food preparation process. The present DNA sequence represents a detection PCR primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Detecting or quantitating a nucleic acid analyte in a sample by contacting the sample with an analyte-binding, labeled and linear stem oligonucleotide and a capture polymer to form a complex and detecting o

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the initiation coden, coding regain, 5 or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nuclectides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway definication and a second active agent comprising an entilnflammatory steroid and ubjquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine or receptor, producing bronchodilation, increasing levels of definitions or receptor, producing bronchodilation, increasing levels of butterior is the composition or condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           lung surfactant in a subject's tissue, or treating bronchoconstriction, ung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO

The invention relates to a method for generating insulin-secreting cells from precursor stem cells or adult pancreatic exocrine cells. The method comprises exposing the precursor cells or exocrine cells to: a nucleic acid molecule encoding neurogenin 3 (ngn3) or NeuroD/Deta2; or an activator of ngn3 or NeuroD/Deta2 gene expression, under conditions effective to generate the insulin-generating cells from the precursor or exocrine cells. The invention is useful in generating insulin-secreting cells from precursor stem cells or adult pancreatic exocrine cells is useful for generating glucose sensitive insulin secreting beta cells useful for generating of or in situ development of insulinsecreting cuitable for transplantation, and for in situ development of insulinsecreting premature differentiation of precursor stem cells into insulin-secreting premature differentiation of precursor stem cells into insulin-secreting cell differentiation. The present sequence is human RT-PCR primer for isolation of mouse ngn3 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                         stem cell;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Generating insulin-secreting cells from precursor stem cells or adult pancreatic exocrine cells, for generating glucose sensitive insulin secreting beta cells for transplantation, comprises using neurogenin3

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers; (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition
                                                                                                                                          Human; antisense; bronchoconstriction; allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic; antiinflammatory; antiasthmatic; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distress syndrome; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; bronchitis; pulmonary transplantation rejection; ss; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respirator, distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         of the invention has antiallergic, and intinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pharmaceutical composition for treating asthma, has antisense oligonuclectide containing less percentage of adenosine, targeted unucleic acids associated with lung airway or lung dysfunction, and
                                                                                                 A1/A3 antisense receptor-associated oligonucleotide SEQ ID 9379.

periodontal ligament fibroblast and its use for detection of periodontal ligament fibroblast and its use for detection of periodontal ligament fibroblast, mass-isolation of PDLs17 protein, and production of an antibody specific to the PDLs17. The specification also discloses a polypeptide encoded by an mRNA is selected from the group consisting of PDLs5, PDLs21, PDLs22, PDLs31 which are selectively expressed in periodontal ligament fibroblast and a biological probe selected from cDNAs of PDLs 5, 17, 22, 25 and 31. An antigenic peptide for PDLs17 is selected from the peptides disclosed in the specification. An antibody capable of binding the PDLs17 polypeptide is prepared by administrating the PDLs17 peptide into an animal. This sequence corresponds to a PCR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel polypeptide pdls17 specific to periodontal ligament fibroblast and the use thereof.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel PDLs17 polypeptide which is specific to

The invention relates to a novel predictor set comprising a plurality of polynucleotides and/or polypeptides whose expression pattern is predictive of the response of cells to treatment with a compound that modulates protein tyrosine kinase activity or members of the protein tyrosine kinase activity or members of the protein tyrosine pathway. The molecules of the invention demonstrate cytostatic, antiangiogenic, vasotropic and vulnerary activities and may be useful in the field of pharmacogenomics, in particular for determining drug sensitivity and in treating breast cancer, hypervascular diseases, angiogenesis and scars in wound healing. The current sequence is that of a human protein tyrosine kinase biomarker-related RT-PCR primer of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a polynucleotide isolated from a human gene and is useful for detecting a single nucleotide polymorphism in a human gene or for diagnosing of disease. The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                    Novel polynucleotide useful for PCR amplification along with two DNA fragment from another set of sequences, or for detecting single nucleotide polymorphism in human gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

New nucleic acid molecule for diagnosing, preventing or treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to an isolated nucleic acid molecule ancoding a polypeptide which is believed to be cytostatic, antiinflammatory, immunosuppressive, antibacterial and virucidal. The composition and methods are useful for diagnosing, preventing and treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases. The present sequence represents a human secreted brotein encoding sequence. The present sequence is available on WIPOWEB and is not in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Williams LT, Chu K, Lee E, Hestir K, Beaurang PA, Behrens D

The method of the invention has cytostatic applications and may be useful for identifying a risk of breast cancer, as well as therapeutic and prophylactic treatments that specifically target breast cancer, such as gene therapy. The current sequence is that of an Extend primer of the invention which was used to genotype single nucleotide polymorphisms within human chromogranin B (CHGB; secretogranin 1;SCG1) DNA which is located at chromosomal position 20pter-pl2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Identifying a subject at risk of breast cancer by detecting the presence or absence of one or more nuclectide polymorphic variations, useful for diagnosing, preventing and/or treating breast cancer.
                                                                                                                                                                                                                                                breast cancer; cytostatic; gene therapy; human; chromogranin B; CHGB; secretogranin 1; SCG1; chromosome 20pter-p12; ss; PCR; primer; SNP; single nucleotide polymorphism.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention relates to a novel isolated polynucleotide comprising a nucleic acid sequence, the human MRCK1 gene located at position 11q13, and the novel human protein kinase MRCK1 encoded by it. The sequence of the invention has sequence homology to rat myotonic dystrophy kinase-related Cdc42 binding kinase (MRCK). The invention may be useful for disagnosing, prognosing, and treating kinase-related diseases, preferably diseases associated with aberrant expression of MRCK1. The present sequence is that of a DNA sequence which is part of the human MRCK1 gene which may be a target for a short inhibitory (siRNA) sequence and which is related to the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                           New human protein kinase MRCKI with 65% sequence homology to rat myotonic dystrophy kinase-related Cdc42-binding kinase (MRCK), useful in diagnostics and as a drug target.
                                                               protein kinase; MRCK1; myotonic dystrophy kinase; Cdc42 binding kinase; MRCK; kinase-related disease; short inhibitory RNA; siRNA; ds; human.

The invention relates to the determination of the concentration of a nucleic acid target, using a fluorescently labeled probe which produces creduced fluorescence emission when hybridised to the target nucleic acid. The method comprises measuring the reduction in emission caused by the real-time polymerase chain reaction, e.g. for nucleic acids by a real-time polymerase chain reaction, e.g. for quantifying microbial cells in co-oultures or symbictic systems, for quantifying microbial cells in co-oultures or symbictic systems, for detecting gene mutations or polymorphisms, and for analysing melting curves of target nucleic acids to determine a Th value. Methods of the invention allow target nucleic acids to be quantified quickly, easily and accurately. Particularly there is no need to remove unbound probe, and no accurately. Particularly there is no need to remove unbound probe, and no conventional PCR conditions can be used). The specificity of PCR is kept high (amplification of primer dimers is delayed), and the limit of conventional person of primer dimers is allowed, and amplification of primer dimers is allowed. Can be monitored in real time. The working graph for data analysis (automatically generated by a computer) has a higher correlation coefficient than conventional graphs so more accurate quantitation is possible. The current sequence represents a synthetic characteristy of a target nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Determining the concentration of a target nucleic acid, useful e.g. for detecting genetic mutations, comprises using a fluorescently labeled probe in which emission is reduced by binding to the target nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                              Yokomaku T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

Measurement of nucleic acids, using a nucleic acid probe and analysis of
the obtained data.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Measurement of nucleic acids, using a nucleic acid probe and analysis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention relates to a method for measuring nucleic acids using a nucleic acid probe labelled with a fluorochrome. The nucleic acid probe decreases the fluorescence of the fluorochrome when hybridised with a target nucleic acid, the decrease in the fluorescence is measured. The method can be used for measuring a target nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                 This invention relates to a method for measuring nucleic acids using a nucleic acid probe labelled with a fluorochrome. The nucleic acid probe decreases the fluorescence of the fluorochrome when hybridised with a target nucleic acid, the decrease in the fluorescence is measured. The method can be used for measuring a target nucleic acid

                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to the determination of the concentration of a nucleic acid target, using a fluorescently labeled probe which produces reduced fluorescence emission when hybridised to the target nucleic acid. The method comprises measuring the reduction in emission caused by the method comprises measuring the reduction in emission caused by the method comprises measuring the reduction in emission caused by the real-time polymerase chain reaction, e.g. for charlifying microbial cells in co-cultures or symbiotic systems, for detecting gene mutations or polymorphisms, and for analysing melting curves of target nucleic acids to determine a Tm value. Methods of the invention allow target nucleic acids to be quantified quickly, easily and accurately. Particularly there is no need to remove unbound probe, and no materials are introduced that inhibit amplification by Taq polymerase (so conventional PCR conditions can be used). The specificity of PCR is kept of migh is reduced. Complex probes are not needed, and amplification can be monitored in real time. The working graph for data analysis (automatically generated by a computer) has a higher correlation coefficient than conventional graphs a synthetic quantitation is possible. The current sequence represents a synthetic quantitation is decorrelation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                      Determining the concentration of a target nucleic acid, useful e.g. for detecting genetic mutations, comprises using a fluorescently labeled probe in which emission is reduced by binding to the target nucleic acid.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to nucleic acid probes, which are useful for assaying nucleic acids by hybridising with a target nucleic acid, in which a single-stranded oligonucleocide is labelled with a fluorescent substance and a quencher in a manner that the fluorescence intensity of the hybridisation reaction system is increased after completion of the hybridisation but no stem loop structure is formed. The probes are useful for assaying nucleic acids and their polymorphism and mutation, particularly useful for e.g. analytical applications, disease diagnosis and microbial identification. The present sequence was used to illustrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Fluorescently-labeled nucleic acid probes for assaying nucleic acids and their polymorphism and mutation, particularly useful in science and medicine for e.g. analytical applications, disease diagnosis and microbial identification.

The probes are useful for assaying nucleic acids and their polymorphism and mutation, particularly useful for e.g. analytical applications, disease diagnosis and microbial identification. The present sequence was used to illustrate

The present sequence represents a potential triple-helix forming region. It can be used to demonstrate the assay of the invention. The assay comprises adding a sample containing double-stranded DNA test sequences. e.g. containing the present sequence, to an aqueous medium containing at least one complex of anchor DNA, attached to a solid support, and reporter DNA, where either a part of the anchor DNA or reporter DNA is sequence. Triple-strand structure with part of the test sequence. Triplex formation results in displacement of the reporter DNA which is detected as an indication of the presence of the DNA test sequence. The method is used to detect DNA sequences, particularly for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 identification of bacteria (by detecting genes for ribosomal RNA) in clinical samples, but also detection of oncogenes and Hepatitis B virus

The invention relates to detecting single nucleotide polymorphisms by contacting an allele-specific oligonucleotide primer (PI) with a target contacting an allele-specific oligonucleotide primer (PI) with a target contacting an allele-specific oligonucleotide primer (PI) with a target sequence is complementary to PI at one end but the terminal nucleotide and the circumal nucleotide and the complementary. The complex is then contacted with an exchuclease complementary. The complex is then contacted with an excurclease deficient DNA polymerase enzyme under conditions that promote extension of PI with the target DNA as the template, thereby forming an extended segment of PI. Oligonucleotide probes whyridising to one or more target polymucleotides distinguish between matched and mismatched 3' ends, hence the absence of sequence amplification indicates the presence of a single amplification target circle can be used in rolling circle amplification can be used in rolling circle amplification and is useful for diagnosing a disease caused by, induced by or related to a mutation in at least one gene, such as parkinson's disease, polycystic kidney disease, Tayancha disease, Huntington disease, sickle cell anaemia, haemophilia, cystic fibrosis, diabetes, obesity, cancers of the head, neck, skin, brain, oseophagus, stomach, lung, breast, colon, ovary, testis or prostate, leukaemia, lymphoma and malanoma. Sequences AASSS711-AASSS745 represent primers, targets and fluorescence decorators used in the detection of RCA products Detecting single nucleotide polymorphism involves amplifying target sequences using small primer probe that matches or mismatches to target sequence and extending primer probe which is then detected. retarding the conversion of a hormone-dependent cancer into a hormone-independent cancer. The agents can be used to treat prostate, breast, cervical and ovarian cancers and to make hormonal drugs for retarding the conversion of a hormone-dependent cancer into a hormone-independent cancer. The drug can retard the change of hormone-dependent cancers into hormone-independent cancers effectively. The present sequence represents a PCR primer which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a hormonal drug-containing agent (I) for

This invention relates to a novel therapeutic agent for the treatment of hormone dependent cancer that comprises a hormone group chemical agent and a differentiation inducing agent. Specifically, the hormone group chemical agent refers to an agonist derived from the lutainising brownereleasing hormone (LH-RH), whereas the differentiation inducing agent is preferably a fat soluble vitamin, or can be a nuclear receptor ligand, histone acetylation regulation drug or a DNA methylation regulation drug or a DNA methylation regulation drug or therapeutic agent for hormone dependent prostate, ovarian, uterine or breast cancer, and can also delay change in hormone independent cancer. Accordingly, the compositions of the invention are described as degenerate PCR primer used to amplify the insulin receptor, in an exemplification of the invention.
                                                                                                                                                                       Novel therapeutic agent of hormone dependent cancer, comprising hormone group, chemical agent and differentiation inducing agent, useful for treating hormone dependent cancer in mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      hormone dependent cancer; hormone; differentiation inducing agent; luteinising hormone-releasing hormone; LH-RH; fat soluble vitamin; prostate; ovarian; uterine; breast cancer; hormone independent cancer; anti-tumour; PCR; primer; ss; EGF receptor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a hormonal drug-containing agent (1) for retarding the conversion of a hormone-dependent cancer into a hormone-independent cancer. The agents can be used to treat prostate, breast, cervical and ovarian cancers and to make hormonal drugs for retarding the conversion of a hormone-dependent cancer into a hormone-independent cancer sancer. The drug can retard the change of hormone-dependent cancers into hormone-independent cancers into a prement sequence represents a PCR primer which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    hormone dependent cancer; hormone; differentiation inducing agent; luteinising hormone-releasing hormone; LH-RH; fat soluble vitamin; prostate; ovarian; uterine; breast cancer; hormone independent cancer; anti-tumour; PCR; primer; ss; insulin receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                           셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                            hormone dependent cancer that comprises a hormone group chemical agent and a differentiation inducing agent. Specifically, the hormone group chemical agent cancer that comprises a hormone group chemical agent refers to an agonist derived from the luteinising hormone releasing hormone (IH-RH), whereas the differentiation inducing agent is preferably a fat soluble vitamin, or can be a nuclear receptor ligand, histone acetylation regulation drug or a DNA methylation regulation drug. The present invention describes using the IH-RH agonist as a preventative or therapeutic agent for hormone dependent proseate, ovarian, uterine or breast cancer, and can also delay change in hormone independent cancer. Accordingly, the compositions of the invention are described as exhibiting high anti-tumour activity. This oligonucleotide sequence is a degenerate PCR primer used to amplify the epidermal growth factor (EGF) receptor, in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New nucleic acids, useful for regulating T-cell mediated immune responses, e.g., suppressing T-lymphocytes in subjects with autoimmune disorders, or enhancement in those with viral infections, comprises novel

molecules of the invention may be used to suppress or eliminate T-
lymphocytes undergoing activation to suppress T-lymphocyte mediated
immune response in individuals suffering from immune disorders, e.g.
autoimmune disorders such as graft rejection or graft-versus-host
disease. They may also be used to enhance T-lymphocyte mediated immune
response in individual suffering from, e.g. viral infection. The present
sequence is Fugu rubripes lymphocyte kinase (LCK) amplifying PCR primer
used in the exemplification of the invention. (Updated on 29-AUG-2003 to
standardise OS field)

The specific target sequence of this oligomer is the human turnour necrosis factor beginning at nucleotide 1137 contg. a purine rich sequence concd. on one strand of the duplex. The oligomer, and others like it are useful in diagnosis and therapy of diseases characterised by specific DNA duplex targets, e.g. HPV, HER; HIV, hepatitis B, herpes, malignant tumours and inflammation. The triple helices form under mild conditions thus assays may be carried out without subjecting the test specimen to harsh conditions. See also AAQ25452-25501 and AAQ30226-448s. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gag; pol; retroviral vector construct; gag/pol expression cassette; antivaral; immunomodulatory; cytotoxin; prodrug activator; replacement gene; antisense sequence; ribozyme; tumour prevention; viral infection; genetic disorder; ss.

The invention relates to a retroviral vector construct which consists of a 5'-long terminal repeat (5'-LTR); a tRNA binding site; an origin of second strand DNA synthesis; a 3'-LTR and gag/pol sequences modified to contain two or more stop codons. The invention also relates to a gag/pol expression cassette, and an env expression cassette. The retroviral construct has anticancer, antiviral and immunomodulatory activity. The retroviral constructs are used to produce recombinant retroviral particles for use in gene transfer, particularly gene therapy, e.g. to deliver heterologous sequences that encode cytotoxins, prodrug activators, replacement genes, antisense sequences or ribozymes, immune accessory molecules and viral immunogens, particularly for treatment or prevention of tumours, viral infections and

                                                                                                                                                                                                                                                                                                The invention relates to a gag/pol expression cassette comprising a promoter, a gag/pol gene (I) and a polyadenylation sequence in which the 5' end of (I) has been modified to contain codons that are degenerate for gag, or the 3' end of (I) has been deleted without affecting the biological activity of the encoded integrase. The expression cassette and similar cassettee that express env protein, are used to produce recombinant retroviral particles by homologous recombination. These particles are gene transfer vectors, particularly for gene therapy of tumours or viral infections, also to induce an immune response, to treat or prevent diseases, or to suppress graft rejection or immune/autoimmune responses. This sequence represents an oligonuclectide primer used in construction of gag/pol expression cassettes of the invention
                                                                                                                                                                                                            New gag/pol expression cassette, for preparing retroviral particles for gene therapy, comprises a promoter, a gag/pol gene, and a polyadenylation sequence, and cannot form a replication competent virus by homologous recombination.
                                                                                                                                                              Driver DA;

Human Vbeta gene repeat sequence #120.

human; T-cell associated disease; Vbeta; autoimmune disease; degenerative nervous system disease; graft versus host disease; hypersensitivity disease; infectious disease; neoplastic disease; Addison's disease; arrophic gastritis; degenerative nervous system disease; multiple sclerosis; Alzheimer's disease; hypersensitivity disease; type I hypersensitivity; Goodpasture's syndrome; type II hypersensitivity; Goodpasture's syndrome; type IV hypersensitivity; leprosy; infections disease; viral infection; HIV; fungal infection; Candida; parasitic infection; schistosome; filaria; bacterial infection; Mycobacterium; neoplastic disease; lymphoproliferative disease; leukaemia; lymphoma; cancer; brain cancer; breast cancer; ds

Human; CD40L; promoter; CD40 ligand promoter; rheumatoid arthritis; diagnosis; antiarthritic; antirheumatic; immunosuppressive; antiinflammatory; inflammatory disease; autoimmune disease; ds.

CD40L poly-A tract sequence SEQ ID NO:9.

Homo sapiens

```
The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each 'Deta gene,' UberaRNA or CDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases including autoimmune disease, degenerative nervous system diseases, and neoplastic diseases. Autoimmune diseases include Addison's disease, arophic gastrits. Degenerative nervous system diseases include multiple arophic gastritis. Degenerative nervous system diseases include multiple clerophic astritis. Degenerative nervous system diseases include multiple sclerosis and Alzheimer's disease. Hypersensitivity diseases include multiple in hypersensitivities such as those present in Goodpasture's syndrome and Type IV hypersensitivities such as those caused by viruses such as HIV, fungal infections such as those caused by chistogomes, filteria and bartail infections such as those caused by schistosomes, filteria and bacterial infections such as those caused by schistosomes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
Kit for diagnozing and treating T-cell associated diseases e.g. autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a

The present invention describes an isolated, purified nucleic acid, which is an altered CD40 ligand (CD40L) promoter (1) for CD40 ligand, having residues 331-455 of the sequence comprising 455 nucleotides given in AAF74905 where A in the wild type sequence at position 331 (corresponding antirheusatic, immunosuppressive and antirhilammatory activities, and can be used in gene therapy. (I) is useful in the study, diagnosis and treatment of inflammatory and autoimmune diseases, as well as diseases in which elevated expression of CD40L is a factor, e.g., rheumatoid arthritis. The present sequence represents a CD40L poly-A tract sequence which is used in an example from the present invention
                                                                                                                                                                                                                                              New altered CD40L promoter for use in the study, diagnosis and treatment of a variety of inflammatory disorders and autoimmune diseases, such as rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 29 BP; 22 A; 4 C; 0 G; 3 T; 0 U; 0 Other;

The present invention describes an isolated, purified nucleic acid, which residues 331-455 of the sequence comprising 455 nucleotides given in AAF74905 where A in the wild type sequence at position 331 (corresponding to position -125) is replaced with C. (I) has antiarthritic, and can be used in gene therapy. (I) is useful in the study, diagnosis and can be used in gene therapy. (I) is useful in the study, diagnosis and which elevated expression of CD401, is a factor, e.g., rheumatoid arthritis. The present sequence represents a CD401 poly-A tract sequence which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes an isolated, purified nucleic acid, which is an altered CD40 ligand (CD40L) promoter (1) for CD40 ligand, having residues 331-455 of the sequence comprising 455 nucleotides given in AAF74905 where A in the wild type sequence at position 331 (corresponding to position -125) is replaced with C. (1) has antiarthritic, antirheumatic, immunosuppressive and antiinflammatory activities, and can be used in gene therapy. (1) is useful in the study, diagnosis and treatment of inflammatory and autoimmune diseases, as well as diseases in which elevated expression of CD40L is a factor, e.g., rheumatoid arthritis. The present sequence represents a CD40L poly-A tract sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New altered CD40L promoter for use in the study, diagnosis and treatment of a variety of inflammatory disorders and autoimmune diseases, such as rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; CD40L; promoter; CD40 ligand promoter; rheumatoid arthritis; diagnosis; antiarthritic; antirheumatic; immunosuppressive; antiinflammatory; inflammatory disease; autoimmune disease; ds.

The present invention describes an isolated, purified nucleic acid, which is an altered CD40 ligand (CD40L) promoter (1) for CD40 ligand, having residues 331-455 of the sequence comprising 455 nucleotides given in AAF74905 where A in the wild type sequence at position 331 (corresponding antirheumatic, immunosuppressive and antinflammatory activities, and can be used in gene therapy. (1) is useful in the study, diagnosis and treatment of inflammatory and autoimmune diseases, as well as diseases in which elevated expression of CD40L, is a factor, e.g., rheumatoid arthritis. The present sequence represents a CD40L poly. A tract sequence which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New altered CD40L promoter for use in the study, diagnosis and treatment of a variety of inflammatory disorders and autoimmune diseases, such as
                                                                                                                                                                                Human; CD40L; promoter; CD40 ligand promoter; rheumatoid arthritis; diagnosis; antiarthritic; antirheumatic; immunosuppressive; antiinflammatory; inflammatory disease; autoimmune disease; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0.4%; Score 14.6; DB 1; Length 29; 59.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes an isolated, purified nucleic acid, which is an altered CD40 ligand (CD40L) promoter (1) for CD40 ligand, having residues 331-455 of the sequence comprising 455 nucleotides given in AAP74905 where A in the wild type sequence at position 331 (corresponding to position -125) is replaced with C. (1) has antiarthritic, antirheumatic, immunosuppressive and antiinflammatory activities, and can be used in gene therapy. (1) is useful in the study, diagnosis and treatment of inflammatory and autoimmune diseases, as well as diseases in which elevated expression of CD40L is a factor, e.g., rheumatoid arthritis. The present sequence represents a CD40L poly-A tract sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New altered CD40L promoter for use in the study, diagnosis and treatment of a variety of inflammatory disorders and autoimmune diseases, such as rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                             The present invention relates to a method for affixing a peptide acceptor to an RNA molecule through the formation of a covalent bond, noncovalent bond, or by chemical ligation. The method is useful for producing RNA-protein fusions which can be used for the isolation of proteins or mucleic aids with desired properties from large pools of partially or completely random amino acid or nucleic acid sequences. The present sequence is a DNA oligonucleotide used in the present invention
                                                                                                                                                                                                                                   an
                                                                                                                                                                                                              Affixing a peptide acceptor to an RNA molecule useful for producing fusion proteins for isolating proteins or nucleic acids with desired properties through attachment of a peptide acceptor to the 3' end of RNA molecule.

The complex is useful for detecting HCV replicase activity and permits establishment of sensitive RNA-dependent RNA polymerase assays to screen and evaluate antiviral inhibitors and to improve the specificity and efficacy of the inhibitors. The complex is also useful in the development
                                                                                                                                                        Novel replicase complex comprising hepatitis C virus NS5B replicase, a 3 nucleotide-long template to which a 2 nucleotide-long primer is annealed, and template and primer which do not form a stable duplex in the absence of HCV NS5B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          of a reliable system for determining kinetic and thermodynamic constants of HCV NSSB-catalysed nucleotide incorporation and investigation of mechanistic inhibitors for mis-incorporation or chain termination. Specifically, the short RNA template and primer pairs are useful in screening assays which are used for determining kinetic, thermodynamic and mechanistic properties of NSSB replication and ultimately in the development of inhibitors of NSSB. Newly identified inhibitors of
